60 Foot JPole Sr replacement element.

To install the element, place the longer element marked with red on the bolt marked with red, which is also a little shorter on the housing (AutoMatch), when you look at how far both bolts protrude out of the housing. Then the shorter element marked with black installs on the bolt marked with black that is extruding a little longer.

Never loosen the nut that is against the housing of the match. Instead, hold it still with one tool while loosening the nut that holds the ring connector in place.

NOTE – The longer element goes to the bolt marked with Red. If the Red mark has faded, then please note that the bolt that would be Red is three threads shorter than the other bolt.

60 Foot JPole Sr replacement element

Verified review - view original

These antennas work remarkably well. Minimal tuning required.

60 Foot JPole Sr replacement element

Verified review - view original

The Alpha J-Pole end fed antenna keeps serving me well on all bands and frequently outperforms end fed antennas twice the length. I have one of these in use at both of my houses, each at about 25feet up. Replacement of a damaged wire was quick and easy. We have several Alpha Antennas in service and each works very well. The FMJ serves us for portable and stationary-mobile and we still have several of the previously produced E-Z Military with collapsible whips in use. Thanks for making great antennas! Maury WB2MSB
