

Anti-Oxidant compound for mounts and elements by Ox-Gard

Use occasionally to protect metals such as mounting hardware and antenna elements after they have been thoroughly cleaned.

If you have a legacy black whip that uses a shock-cord, then you may need to use steel wool to clean the inserts before applying this compound.

If you have never cleaned the inserts, they may be too corroded to be salvageable.

Ox-Gard Anti-Oxidant Compound contains prime grade zinc and is formulated with metallic zinc to create a compound that enhances electrical and thermal conductivity which is used on high power crimp connections and stud bolt mountings.

When the connection is tightened, the grease is displaced, leaving a layer of zinc filling in the surface imperfections of the interface. This has a twofold effect; it improves electrical conductivity and it improves thermal conductivity. This reduces the connection temperature under high power conditions by a reduced voltage drop and by providing a heat conductivity path to the connection's substrate. Ox-Gard Anti-Oxidant Compound is manufactured with unique grease compounded from custom refined low sulphur oil. The grease base ensures brush-ability over a wide temperature range, tenacious adherence to all surfaces, resistance to water wash out and the prevention of rust and corrosion. This makes the product easier and more reliable to use.

- Makes connections more reliable
- Makes connections more weatherproof
- Protects connections from corrosion
- Reduces temperate rise
- Low sulphur content
- Non-reactive, no gassing in storage
- Brushable over a wide temperature range
- Sticks to wet joints
